Excerpt: .two obvious misprints, that he has thus calculated $m = 5-6295$. $B = -(1+0.048 \cdot -)$, giving $wm+20-8333$. $m--117-281$. $n=0$, for which, $mn+21m--Wn=0$ is a sufficiently close approximation, and represents the mean variation very fairly, after the first 5000 feet of ascent. t Mr. Glaisher has laid down these in the Proceedings of the British Meteorological Society, vol. i. (19 Nov. 1862) plate 13, with which I have compared the theoretical hyperbola. These comparisons have been obtained by calculating the height attained for each inch of depression of the barometer, from the 1st to the 16th, taking for the bottom may therefore be considered as the normal alteration of temperature. In order to secure simultaneous observations at both stations for each section, it would be necessary to have two ascending parties, one for each variable station, each of which should be able to signal to the other....
