Excerpt: . . . year. The 1972 loads for Lakes Erie and Ontario are estimated since monitoring didn't start until 1975. The values at the right are the Agreement estimated loads. We have essentially achieved the target phosphorus loads set in the Agreement. What are the lake effects The 1983 Great Lakes Water Quality Board Annual Report contains the following information: . Lake Ontario--conditions have tentatively improved. The spring lake-wide phosphorus concentration has decreased, and a shift has occurred in open lake phytoplankton species from mesotrophic to oligotrophic types. . Lake Erie--A tentative conclusion is that the whole-lake spring phosphorus concentration has decreased and the lakewide autumn concentration of chlorophyll a has decreased. 0 Saginaw Bay--Algal species have shifted from blue-greens to diatoms and greens (indicating a shift from eutrophic to mesotrophic conditions). Are the phosphorus control strategies cost-effective results What is the lake response to a decrease in phosphorus load Should phosphorus from land drainage be controlled What would be the benefits and A knowledge of the ecosystem dynamics is required in order to answer costs these questions. The simple mass-balance model uses 1-year time steps and ignores the detailed lake ecosystem processes of the annual cycle. We have apparently solved the relatively simple wastewater treatment problem with the While the effects on phosphorus loads have expenditure of some 7 billion. been dramatic, insufficient understanding of the ecosystem makes it difficult to define...
